## Buildr

The Tempo project uses the "Buildr" tool to compile and package all components. To build these components, you must have the following installed:

- [Ruby 1.8.x](#) 
- [Rake](#) 
- [Buildr](#) 

Typically on a system with Ruby and Gem installed, you can install the latest versions of both Rake and Buildr by issuing:

```
gem install rake
gem install buildr
```

(On most platforms, you need administration privileges to install new Ruby software)

Once you have Buildr installed, you can build projects by running:

```
buildr package
```

## Build Issues

Please report any build issues on the [Tempo developer](#)  mailing list. Thanks!
