Debugging XForms, live version

Debugging XForms, going through the form manager loggers

The first thing you need to do is to update the following logger in the log4j.properties file of your distribution.
Change from this:

```
log4j.category.org.orbeon.oxf=WARN
# Uncomment to debug Orbeon forms
#log4j.category.org.orbeon.oxf.processor.DebugProcessor=INFO
```

to the following:

```
log4j.category.org.orbeon.oxf=WARN
# Uncomment to debug Orbeon forms
log4j.category.org.orbeon.oxf.processor.DebugProcessor=INFO
```

Then, you can put **debug** attribute to show defined values in xpl files of the form manager.
So, for example, in the act.xpl file, you could switch form:

```
<p:param name="data" type="input"/>
```

to

```
<p:param name="data" type="input" debug="act.xpl"/>
```

The orbeon logger will then show the content of **data** in the logs.
